**MVT TILE + THE ENVIRONMENT:**

-

MVT + MVT2 tile are made mainly from natural quartz sand that is harder than granite, and contains plastic only as binder agent. When combined in exactly the right proportions and compressed, these materials produce the most durable floor tile containing plastic. The cleaning of these tiles requires very little energy, water or chemicals making it easy and environmentally friendly.

Approximately 67% of MVT/MVT2 tile is natural quartz sand + calcium carbonate. The elasticity is achieved by using a special compression system manufacturing process instead of excessive plasticizers. Thanks, to the minimal use of plastic, these floors produce even less emissions than wood floors!

MVT/MVT2 tile is extremely hard wearing and does not crack as easily as VCT. The longer life cycle of this tile helps prevent landfills from filling up prematurely.

All vinyl scrap is recycled within the factory.

ALLSTATE MVT/MVT2 is tough, durable, beautiful, warm, and cost effective. It is also low maintenance and friendly to the environment.
